

Mann–Whitney U test for production and test code revisions

Two-sided Mann–Whitney U test comparing the number of revisions of **production** methods versus **test** methods per project. Each row reports the two-sided p -value, Cliff’s δ effect size (d), and its direction sign: + (59 project(s)) indicates that production methods have a higher revision count than test methods ($\delta > 0$); – (50 project(s)) indicates the opposite, i.e. test methods are revised more frequently ($\delta < 0$). Effect size bands follow Romano et al. thresholds for Cliff’s δ : **N** negligible ($|\delta| < 0.147$), **S** small ($0.147 \leq |\delta| < 0.33$), **M** medium ($0.33 \leq |\delta| < 0.474$), **L** large ($|\delta| \geq 0.474$).
